BASIC PLUMBING SKILLS

April 17-22, 2011

William Penn Mott Jr. Training Center

Memorandum

Date: March 31, 2011

To: Supervisor

From: William Penn Mott Jr. Training Center

Department of Parks and Recreation

Subject: Employee Attendance at Formal Training

Basic Plumbing Skills Group 20

An employee from your office will soon be attending the formal training program described in the attached. Please insure that the employee is fully prepared to attend the session and that the groundwork is laid for the employee's implementation of the training upon returning to work.

You can assist with capturing the full value of the training by taking the following steps:

Prior to Training

- 1. Make sure that **specific** employee needs are identified and, if necessary, called immediately to the attention of the Training Coordinator.
- 2. Review with the employee the reason for the employee's attendance.
- 3. Review objectives and agenda with the employee.
- 4. Discuss objectives and performance expected after the training.

Immediately Following Attendance

- 1. Discuss what was learned and intended uses of the training.
- 2. Review the employee's assessment of the training program for its impact at the workplace and review the due date of the Post-Training Evaluation form.
- 3. Support the employee's use of the training at the work place.

Prior to Three Months Following Training

- 1. Employee after discussion with the supervisor login to the Employee Training Management System (ETMS) to complete the Post-Training Evaluation form.
- 2. Supervisor evaluates the effectiveness of the training on the employee's job performance and login to the ETMS to complete the Training Effectiveness Assessment form.

Thank you for your assistance in seeing that the full benefit of training is realized.

Tina L. Williams

Department Training Officer

Ama Welliams

Mission Statement Training Section

The mission of the Training Section is to improve organizational and individual performance through consulting, collaboration, training and development.

Tina Williams	Department Training Officer
Pat Bost	Office Manager
Matt Cardinet	(Acting) Academy Coordinator
Chuck Combs	Training Specialist
Sara M. Skinner	Training Specialist
Dave Galanti	Training Specialist
Karyn Lombard	Training Specialist
Dan Kraft	Cadet Training Officer
Pamela Yaeger	Assistant Program Coordinator
Edith Alhambra	Assistant Program Coordinator
Rogers Williams	Program Assistant

THE MISSION

of the California Department of Parks and Recreation is to provide for the health, inspiration and education of the people of California by helping to preserve the state's extraordinary biological diversity, protecting its most valued natural and cultural resources, and creating opportunities for high quality outdoor recreation.

FORMAL TRAINING GUIDELINES

Welcome to formal training, an essential component in your career development.

Since 1969, our Department has been providing a continuously changing number of diverse training programs at its main training facility, the William Penn Mott Jr. Training Center and other locations including Marconi Conference Center. The Department strives to enhance your learning and job performance with formal training of the highest quality.

Our Department's dedication to training is only one aspect of its commitment to you and to the public. This commitment is costly and represents an important investment in you and your career. You and the Department realize a return on that investment by your positive participation in formal training itself and post training follow-through.

The program you will be participating in is described in this training syllabus, which outlines what you can expect from this training and what is expected of you. This syllabus details what you should do before you leave for training; what to do when you arrive; what you will be doing while in training; and, importantly, what you should be able to do when you return to your work site. Specifically:

- 1. SYLLABUS: The syllabus is now accessible on the Employee Training Management System (ETMS). You should print a copy of the syllabus to bring with you to class. Your copy of this syllabus is an important part of your training experience and should be brought with you to training. Read it before you arrive and review it following the program along with material you received at training.
- 2. PRE-TRAINING ASSIGNMENTS: Your completion of pre-training assignments is essential to the success of your training. You are responsible for all reading assignments in preparation for classroom sessions. Time will be provided during working hours to accomplish any assignments which involve either individual or group efforts and resources. (Pre-training assignments are listed in the "Training Attendance Requirements" section.)

3. TRAVEL: Arrange your travel to and from the training through your District or Office. (No reimbursement for travel expense - including per diem costs - will be approved for travel not specifically authorized in advance by the District Superintendent.) Individuals may claim reimbursement for incidental expenses incurred as outlined in DAM 0410.6. The Mott Training Center does not have the capability to provide transportation to/from Monterey Airport.

The cost of your travel (air fair, mileage, rental car, etc.) is paid by your District or Office **to** and **from** the location of the training.

4. HOUSING: Housing will be assigned to you on a shared-room basis and will be available from 3:00 p.m. on the date of arrival to 12:00 noon on the date of departure. The Department provides your room and board expenses at the Mott Training Center only. No per diem allowance will be authorized for living off-grounds. This does not preclude living off-grounds at your own expense. Please advise the Department Training Officer no later than one week before your scheduled arrival if you plan to live off-grounds. No animals are permitted in Asilomar housing. In the event of an emergency, staff must know your room assignment, therefore, you may not switch rooms without staff approval. Overnight guests are not allowed in the buildings unless registered beforehand at the front desk in Asilomar's Administration Building. Quiet hour for lodge living areas is 10:00 p.m.

<u>Please Note</u>: You may be assigned a room at a motel while attending training. If so you may be asked to present a valid credit or debit card while checking in to your room. Many motels require a credit card to cover charges incurred such as telephone calls, damages to rooms and/or furnishings, fees to clean rooms that have been smoked in that are not designated as smoking rooms, etc. Please be prepared to handle this appropriately.

5. ENROLLMENT OR HOUSING CANCELLATION POLICY: To cancel participation in a course, the participant must have their District Superintendent or Section/Office Manager send an email to the Training Specialist assigned to the course requesting to remove the participant. If you do not need lodging or must change or cancel your reservation for lodging, you must contact the Mott Training Center or Training Specialist assigned to the course at least 72 hours prior to your date of arrival. Lodging, registration, and associated fees will be charged to the employee's District or Section/Office if a training cancellation is received with less than 72 hours notice.

The Mott Training Center is committed to ensuring that the reservation that has been made for you is accurate and needed.

- 6. OFF-GROUNDS ACCOMMODATIONS: When authorized to stay off-grounds by the Department Training Officer, the Mott Training Center will pickup the cost of your room and meals at the current DPR Asilomar rate. If you stay off grounds and have meals on grounds, the Mott Training Center will authorize only what the Department pays Asilomar for lodging.
- 7. MEALS: Meals will be provided, semi-cafeteria style, from dinner on the date of arrival through lunch on the date of departure. Meals will be served at 7:15 a.m. for breakfast, 12:00 noon for lunch, and 6:00 p.m. for dinner. Hot or box lunches may be provided on some days. If you require a special diet, notify the Asilomar Chef at 831-372-8016 no later than one week before your scheduled arrival.

In order to assist participants with limited mobility, Asilomar provides a shuttle to and from the dining hall. Please contact either Asilomar staff upon check in, or Mott Training Center staff upon your arrival, for instructions on arranging a transport.

8. CLOTHING: Field uniforms as found in "Description of Required Field Uniforms", DOM Chapter 2300, Uniform Handbooks, not including optional items, will be worn daily by all uniformed employees during formal training sessions <u>unless otherwise specified in the Program Attendance Checklist</u>. Non-uniformed employees shall wear apparel normally worn on the job. Appropriate attire includes apparel suitable for professional office dress. It does not include such items as shorts, t-shirts, tank tops, or sandals.

Because we are on the conference grounds with many other groups, and the image we project as State Park employees is important not only during working hours but off duty hours as well, your informal sportswear should be appropriate.

- 9. ROOM SAFES: Two safes have been installed in each of the lodge rooms used by the Mott Training Center (Live Oak, Tree Tops, and Deer Lodge). These safes are a type that allows the user to input their own combination of numbers to facilitate opening and closing. The Mott Training Center has a master key for emergency entry. Safes are to be left in the open position when checking out of your room.
- 10. WEAPONS: Weapons are permitted in rooms under the following conditions. Authorized firearms and magazines stored while at the Mott Training Center shall be in a safe condition and stored in one of the following locations: your room safe in Live Oak, Tree Tops, or Deer Lodge, one of the Mott Training Center's safes in the Whitehead Room or secured in your vehicle.
- 11. ALCOHOLIC BEVERAGES: Participants shall not possess or consume alcoholic beverages in common areas (living room) while on the Asilomar Conference Grounds unless provided and hosted by Concessionaire ARAMARK.

- 12. SMOKING: Smoking is not permitted in the Mott Training Center or in any lodge or guest room on the Asilomar Conference Grounds. 13. TRAINING CENTER: The Mott Training Center is located on Asilomar Conference Grounds, part of Asilomar State Beach. The Conference Grounds are operated for our Department by a concessionaire, and all lodging and food services are provided to us by employees of the concessionaire. Constant efforts are made to maintain a sound, harmonious working relationship between the Department and concessionaire. None of us can expect preferential treatment for any reason and, as a departmental employee, you will be expected to join in our continuing effort toward an effective relationship with each Asilomar concession staff member. On occasion, non-departmental groups may be staying in the same lodges. It is imperative that you represent the Department well on and off duty.
- 14. REGISTRATION: When you arrive at Asilomar Conference Grounds, go directly to the front desk at the Asilomar Administration Building for your room key and dining room ticket. If you require vegetarian meals, notify the front desk representative and your meal ticket will be marked accordingly.
- 15. COURSE LEADERS: The formal training you will attend is developed and, for the most part, conducted by experienced State Park employees in field and staff positions. Some courses will be conducted by qualified instructors from other agencies and educational institutions. Your course leaders have proven their ability and knowledge in their profession, and provide a level of expertise difficult to match.
- 16. TRAINING SECTION STAFF: Chuck Combs is your Training Specialist and has been assigned the responsibility for your training group. That staff member usually serves as a Course Leader as well as a Coordinator. During the program, you may be asked to assist Training Section Staff in the logistics of your training program (organizing field trip transportation, supervising classroom breaks, etc.). Training Section Staff will do all within their power to make your training experience pleasant and meaningful.
- 17. TRAINING MATERIALS: May be made available to you at both your unit and the Mott Training Center. Handout materials issued at your unit should be brought to training for possible use. A conference binder or notebook will be issued to you at the training session for note taking and convenience in handling materials. Copies of DAM and DOM will be available to you for self-study. Bring your own pens and pencils.
- 18. ATTENDANCE: Regular attendance is a critical course requirement and your participation is important to the success of this training. An absence of more than 10% of the course hours constitutes grounds for dropping a participant from the course. The Department Training Officer may modify this requirement based upon participant knowledge level and/or the portion of the course missed. All absences,

- except those of an emergency nature, must be approved in advance by the Training Specialist.
- 19. COLLEGE CREDIT: Most training programs are accredited by Monterey Peninsula College for lower division credit. If you successfully complete an accredited program, you will receive either a letter grade or a credit/no-credit designation.
- 20. MPC STUDENT ID: If you have filled out an MPC application before, you have already been issued a Student ID number to use in lieu of your SSN on future applications. You can obtain your MPC Student ID number by going to their secure website and providing your SSN number (no name required) and birthdate.
 - To obtain the number, logon at: http://www.mpc.edu
 - In the column on the left side of the screen, click on Registration (WebReg).
 - In the form that comes up and is titled: Have you applied for a BOG Fee Waiver, enter your Social Security Number in the box that is titled MPC/ID, and enter your birthdate in the second box.
 - Click on Login
 - The system will then come back with your MPC Student Identifier (SID).

You can store your MPC ID number in your ETMS Profile for future reference.

Newcomers to training will need to provide their SSN on the first MPC application only, after which a student ID number will be assigned and available by following the instructions above within a few weeks of the program's conclusion.

- 21. VEHICLES: All vehicles should be parked in the lots adjacent to the Mott Training Center. Any questions regarding use of a State vehicle while at the Mott Training Center should be discussed with your supervisor prior to your departure for training, or with your Program Coordinator while at the Mott Training Center.
- 22. BICYCLES: If you bring your bicycle, store it in the bicycle shed next to the Mott Training Center. Bicycles may not be brought into any building nor chained to lamp posts, trees, etc. The Mott Training Center has a limited number of bicycles available for your use. Prior to your use, you are required to complete a safety inspection and sign a waiver which is posted in the bicycle shed.
- 23. MAIL: Mail forwarded to you during your time at the Center should be addressed to you in care of:

Department of Parks and Recreation WILLIAM PENN MOTT JR. TRAINING CENTER P. O. Box 699, Pacific Grove, CA 93950

- 24. CELL PHONES: As a courtesy to your fellow participants and course leaders ensure that your cell phone is turned off during classes. Participants should not be receiving or making cell phone calls during class time. Please limit those calls to your breaks.
- 25. FAX: The Mott Training Center's FAX number is (831) 649-2824.
- 26. TELEPHONE: Limit phone calls during classroom hours to urgent business or emergencies. Anyone wishing to contact you by telephone during working hours should call the Center at (831) 649-2954. Calls after 5:00 p.m. or during weekends should be made to (831) 372-8016, Asilomar Conference Grounds, and the caller should tell the switchboard operator you are with a California State Parks training group. Please Note: There are no longer pay telephones outside of the Mott Training Center. There are pay telephones located at the Asilomar Administration Building.
- 27. LAUNDRY AND DRY CLEANING: May be taken care of by you at one of several local establishments.
- 28. RECREATION: Facilities available on grounds include a heated swimming pool, ping-pong and pool tables, and a volleyball court. The Monterey area offers horseback riding, golf, tennis, racquetball, deep sea fishing, and many historical landmarks and scenic sights to explore.
- 29. POST-TRAINING ASSIGNMENTS: In connection with formal training are to be completed under the direction of your supervisor. See "Program Attendance Requirements" in this syllabus.
- 30. COFFEE BREAK REFRESHMENTS: Will be available throughout each session. You will be asked to contribute to the "Hospitality Fund" to defray expenses. Please <u>bring your own coffee cup.</u>

PROGRAM ATTENDANCE CHECKLIST

Jr. Training Center the following list is provided:			
1		ad and understand the Basic Plumbing Skills Program Syllabus prior to ir arrival at the Training Center.	
2	2. Coi	mplete the following prior to reporting to training.	
		Review and complete the Basic Plumbing Skills Study Guide included with your syllabus and bring it with you to training. It will be collected during the program orientation.	
		Discuss the Basic Plumbing Skills program with your supervisor. What specific changes in your abilities and performance are expected to result from you attending this training? List these expectations along with your own under "Expectations" on the back of the "Equipment Checklist".	
		Discuss the projects you will be assigned in the next twelve months, which will utilize the skills developed during the training program.	
		Make arrangements with your supervisor to demonstrate your ability to safely use the items listed on the Equipment Checklist. All items must be initialed by your supervisor or your supervisor's representative and signed by your District Maintenance Chief for you to participate in the practical portion of the training program.	
<u>NOTE</u> :	Chec Bring assig If you	ore-training assignment (Basic Plumbing Skills Study Guide, Equipment cklist and Expectations) will be collected during the program orientation. If the required safety equipment and completion of the pre-training plument are mandatory. They will count for 20% of your program grade. If have questions or need help, call Program Coordinator Chuck Combs 1-649-7124 or e-mail at chuck@parks.ca.gov .	
3	3. Arr	ange your travel through your District Office.	
	I. Rei	member to bring the following with you to training:	
	0000 00	Program Syllabus, study guide, and all pre-training assignments. Personal Safety Equipment (eye, ear, head, and hand protection). Coveralls or appropriate work clothing. Foul weather gear due to the possibility of rain during the program. It is required that you bring rain gear with you. Proper field uniform, see Formal Training Guidelines #8. Coffee cup, alarm clock, pens and pencils.	

POST-TRAINING ASSIGNMENT

Prior to ninety days after the completion of this program, the employee and his/her supervisor should sit down and discuss the impact and assess the effectiveness this program has had on the employee. Then both the supervisor and employee should login to the Employee Training Management System (ETMS) and complete the Post-Training Evaluation form (an email will be sent to both employee and supervisor notifying them that the evaluation needs to be completed).

The post-training evaluation process is intended to provide a bridge between classroom instruction and the on-the-job application of training. The information obtained through this process will assist the training participant, supervisor, and Training Center in providing a return on the investment the Department has on training.

BASIC PLUMBING SKILLS GROUP 20 - A G E N D A - April 17-22, 2011

Lead Instructor: John Mackey Assistant Program Coordinator: Dana Sarandria and David Robarts

Special Notice:

This program will be conducted at the Mott Training Center Shop Annex, 2211 Garden Road, Building C, Monterey, California. Vans are available to transport you to and from the Shop Annex and will leave the Mott Training Center promptly at 0800 daily and return by 1700.

BASIC PLUMBING SKILLS

PROGRAM ORIENTATION

<u>Purpose</u>: Participants will meet one another and the program coordinator and facilitator. The group will share expectations for the training program. In addition, program content will be reviewed and registration for Monterey Peninsula College completed.

Performance Objectives: By the close of the session the participant will

- 1. Review program content, procedure, and evaluation processes.
- 2. Share and record expectations with group members.
- 3. Complete Monterey Peninsula College registration materials.
- 4. Adhere to all Training Center guidelines.

INTRODUCTION TO PLUMBING SYSTEMS

<u>Purpose</u>: To familiarize park maintenance workers with plumbing systems, materials and tools which will enable them to make routine plumbing repairs.

Performance Objectives: By the close of the session the participant will

- 1. Review the basic components of plumbing systems used in the general plumbing trades.
- 2. Discuss the materials used in plumbing systems within California State Parks.
- 3. Identify the correct tool to use when making repairs to plumbing components and systems.

INTRODUCTION TO PIPEFITTING

<u>Purpose</u>: To familiarize park maintenance workers with the methods of cutting, joining and repairing plumbing systems found in California State Parks.

Performance Objectives: By the close of the session the participant will

- 1. Identify the common plumbing tools and materials currently used in the plumbing trades.
- 2. Demonstrate correct cutting and joining procedures for PVC plastic pipe.
- 3. Demonstrate correct cutting and joining procedures for ABS plastic pipe, copper pipe and steel/iron pipe.

PLUMBING FIXTURES AND APPLIANCES

<u>Purpose</u>: To familiarize park maintenance workers with a variety of plumbing fixtures, valves and fixture drains.

Performance Objectives: By the close of the session the participant will

- 1. Discuss the more common plumbing fixtures and appliances used in California State Parks and general plumbing trades.
- 2. Review the proper use and function of various plumbing fixtures.
- 3. Identify the knowledge and skills necessary to diagnose plumbing fixture problems and to make subsequent fixture repairs.

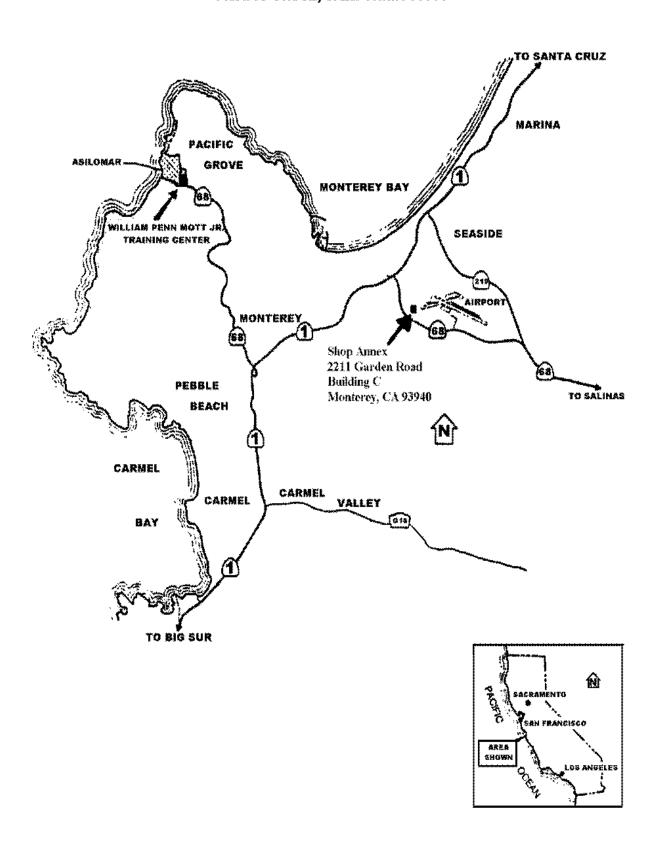

SHOP APPLICATIONS

<u>Purpose</u>: To provide the participant with hands-on instruction and opportunity to practice acquired plumbing knowledge and skills.

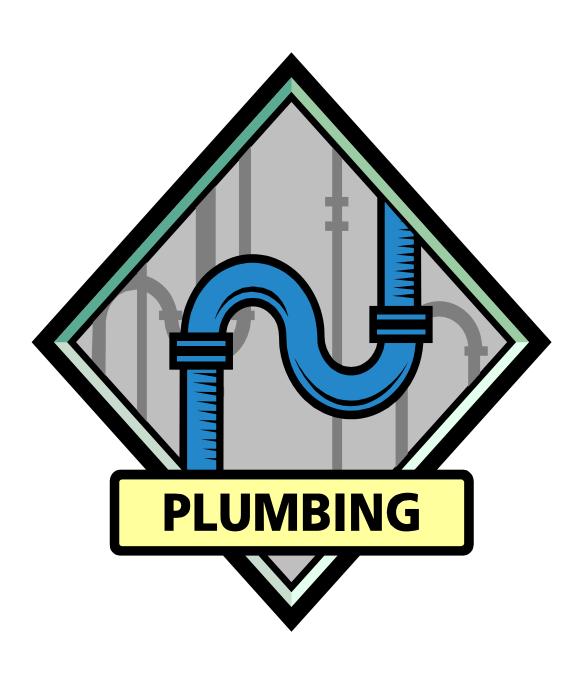

Performance Objectives: By the close of the session the participant will

- 1. Apply classroom knowledge and information to an actual building plumbing repair effort.
- 2. Demonstrate the ability to assemble plumbing components and make repairs.
- 3. Demonstrate the ability to work effectively, safely and harmoniously with other class participants in a simulated work environment.

Basic Plumbing Skills Workbook

INTRODUCTION TO PLUMBING CODES

All work performed on facilities within the California State Park System must comply with State law. Requirements for providing clean water and toilet facilities are defined in the California Health and Safety Code, California Plumbing Code (Title 24), and California Occupational Safety and Health Regulations (Title 8).

The primary law pertaining to plumbing performed by Park Maintenance Worker is the California Plumbing Code (CPC). The California Plumbing Code consists of state standards and sections from the latest edition of the Uniform Plumbing Code (UPC). The CPC must comply with the UPC. The CPC can be more strict than the UPC but, it cannot be less strict. The purpose of the CPC is to provide minimum standards to safeguard the public's welfare against hazards that may arise from the use of plumbing systems in state owned facilities.

The provisions of the CPC apply to construction, alteration, demolition, and repair of all plumbing, gas, or drainage piping and systems, and water heating or treating equipment, in or on any state owned building, structure, or outdoors.

1.	The California Plumbing Code states that additions and repairs buildings must comply with the	s to state owned
2.	The Code applies to all plumbing, gas, or piping.	
3.	The Code also applies to water heating and water	_ equipment.

INTRODUCTION TO PLUMBING SYSTEMS

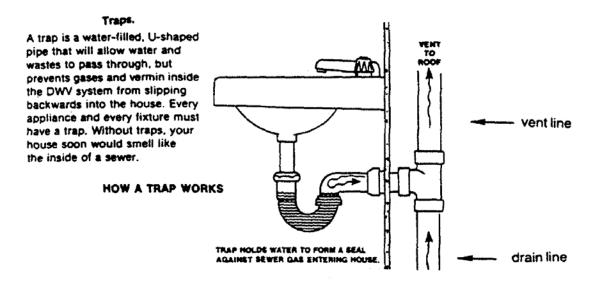

The definition of a "System" is "A group of elements that interact and function together as a whole." Plumbing systems found in state owned buildings include water supply systems, drain-waste-vent systems, fuel supply systems, appliance vent (flue) systems, steam systems, and pneumatic (air) systems. This training program will focus on the water supply systems, drain-waste-vent systems, and fuel supply systems typically found in state park residences and public buildings.

Fresh water is carried under pressure from the well or water meter (service entrance) through the building water supply system to each fixture and appliance. The main water shutoff valve is usually located at the water meter or where the supply line enters the building. Water supply pipes in park houses and offices are generally small, with inside diameters from 3/8 to 1 inch. Supply pipes in public restrooms are generally 1 to 2 inches in diameter. Once inside the building, the water supply pipe is divided at the hotwater heater into hot- and cold-water systems. Pipes for the two systems usually run parallel to each other throughout the building. Some of the cold water-supply pipes end in outdoor faucets (hose bibbs) for garden hoses and irrigation systems.

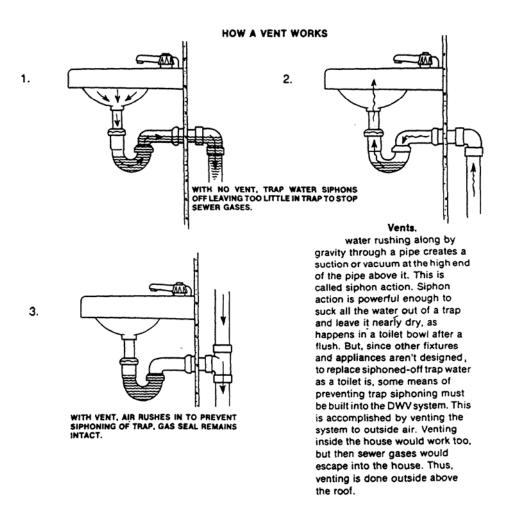

Although called "systems", the cold water system, the hot water system, the solar water heating system, and the irrigation system, are not truly different systems, but are components of one system - the water supply system.

The drainage system is completely isolated from the water supply system. Drain-pipes are generally larger than incoming water-supply pipes, varying from 1-1/2 to 4 inches in inside diameter. The drainage system handles drain water removal, waste removal, and venting. The "Vent" portion of the DWV system extends from the level of the trap arm through the roof. The "Drain" or "Waste" line begins at the fixture and eventually connects to the sewer system. Waste pipes carry wastes by gravity away from each fixture into larger drainpipes which carry the flow downward into the house sewer line. Drainpipes are sloped ¼ inch fall per foot of run and vent pipes are ¼ inch rise per foot run. At each fixture the drain passages contain a P- shaped bend called a trap. Because of its shape, the P-trap is usually the first to clog. The trap retains water that acts as a seal to prevent gases, bacteria, and vermin from entering the house. Vent pipes carry off sewer gases and keep the whole DWV system at atmospheric pressure, necessary to maintain the water seal in each trap. Without venting, pressure from collected gases in any portion of the DWV system could force and break the trap's water seal. If atmospheric pressure were not maintained, trap water would siphon away.

As you study the plumbing systems, be sure to notice that the different systems are never connected, or cross-connected, to any other system. Because the DWV and water supply systems are both opened at the fixture, this is a likely spot for a "cross-connection" to occur. The best method for preventing back-siphoning due to cross connections is to maintain an air separation between the water supply and DWV systems. Maintenance workers must always be alert for any condition which might allow pollutants to back-siphon into the water supply system from fixtures (toilets, lavatories, bathtubs, showers, sinks, and laundry tubs) and appliances (clothes washers, dishwashers, and garbage disposal).

Main vents serving toilets, and secondary vents serving other fixtures, extend though the roof where they are open to the air. Some systems have revents that connect their fixtures to a main or secondary vent instead of going directly through the roof. DWV pipes that carry toilet waste are called soil pipes and must be at least 3 inches in diameter. A large vertical drain-waste line in a building is called the soil stack. The soil stack serves as a vent and a drain. Every DWV system contains plugged openings called cleanouts to provide access to the inside of the DWV system for removal of blockages. To remove blockages, use a plunger, snake, auger, hose (beware of crossconnection) or other mechanical means. Chemical drain cleaners **should not** be use unless all other mechanical means have failed.

4.	into the building and around to all the fixtures and appliances.
5.	The portion of the DWV system carries used water and waste out of the building.
6.	The portion of the DWV system carries sewer gases out of the building and maintains in the drain pipes.
7.	The main water shutoff valve, which turns the water for the entire building on and off is usually located at the or where the supply line the
8.	Once inside the building, the water supply line is divided at the water heater and becomes the and water supply systems.
9.	The hot water supply line is typically installed to the cold water supply line.
10.	The water supply line brings water into the building under pressure, the drainwaste lines carry waste water away by
11.	The normal pitch for drain-waste lines is inch of fall per foot of run.
12.	The cold water system, hot water system, solar water heating system, and irrigation system components of the system.
13.	The allows water and waste to pass but prevents gases and vermin from entering the house through the DWV system.
14.	are installed in the DWV system to prevent fixture traps from siphoning.

INTRODUCTION TO PLUMBING AND PIPEFITTING

WATER SUPPLY

The California Plumbing Code (CPC) states: "Except where not deemed necessary for safety or sanitation by the Administrative Authority, each plumbing fixture shall be provided with an adequate supply of hot and /or cold potable running water piped thereto in an approved manner...".

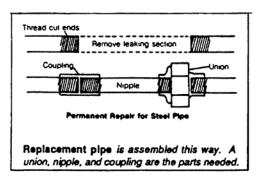

Water pipe and fittings may be made of brass, copper, cast iron, galvanized malleable iron, galvanized wrought iron, galvanized steel, polyethylene (PE), and Polyvinyl Chloride (PVC). The most commonly used materials in State Park water supply systems are brass & copper, galvanized steel, and Polyvinyl Chloride (PVC).

Steel (Galvanized) Pipe

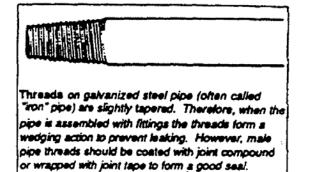

Steel (galvanized) pipe has been used in more park facilities than any other plumbing material. Steel pipe was commonly used for water supply systems in residences built before 1970, and is still used in outdoor areas where a tough material is needed to withstand physical impact or earth movement.

Corrosion on the outside of galvanized steel pipe can be reduced by minimizing the number of places the pipe is held with the vise or wrenches. Where the zinc coating has been damaged, the life of the pipe may be prolonged by treating the damaged areas with cold zinc compound, wrapping tape, or asphaltic emulsion.

Two problems with steel pipe are corrosion and mineral build-up. When working with galvanized steel pipe, the pipe wrenches and threads damage the pipes protective zinc coating. When the zinc is removed, the pipe will rust and eventually leak. Inside the pipe, rust begins to form as the water and chemicals dissolve the protective interior zinc coating. Blister like "tubercles" form on the pipe walls, restricting and eventually choking off the flow of water. Mineral deposits will also collect inside steel pipe to further reduce the flow of water. When this happens, replacing the pipe is the only remedy. To replace a leaky section, cutout section with hacksaw or reciprocating saw. Thread ends using generous cutting oil and stop threading when one thread extends past the cutter. Use a nipple, coupling and union, as shown at right to complete repair. The parts inside the union are not coated with compound.

Iron pipe fittings have either "male" or "female" threads. The threaded end of a galvanized pipe or nipple can be described as having "male iron pipe threads" (abbreviated mipt or mpt). A "coupler" or "elbow" ("ell") can be described as having "female iron pipe threads" (abbreviated fipt or fpt).

Pipe threads are tapered. The taper creates a wedging action that produces tremendous pressure as the threads are turned into a fitting. Pressure alone is not enough to prevent a joint from leaking. Before assembling the pipe, the male threads must be sealed with pipe joint compound or Teflon joint tape. The joint compound/tape works with the tapered pipe threads to prevent leaks. The tape must be wound in the direction the treads turn into the pipe fitting. Brass valves and fittings are easily damaged. Avoid over tightening.

15.	coating.
16.	To remove a section of galvanized pipe where no union has been installed, the pipe must be cut with a or reciprocating saw.
17.	When threading galvanized pipe use generous amounts of oil.
18.	When threading galvanized pipe, stop threading when the pipe extends about beyond the cutter.
19.	Pipe threads will leak if not properly sealed. To seal pipe threads apply joint (TEFLON) tape or pipe joint compound to the threads only.
20.	TEFLON joint tape must be wound around the threads in the direction the threads turn into the pipe fitting.
21.	The repair parts needed to replace a section of pipe are a, a, and a
22.	The pipe ends inserted into a union fitting should be coated with thread compound or tape. The parts inside the union coated.

02/10/11

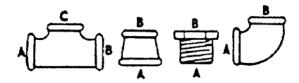

Copper Pipe

Copper pipe (Rigid or Flexible) is superior to galvanized pipe in almost every application. Rigid copper pipe is sold in 10 or 20 foot lengths. Flexible is sold in 60 foot coils. It is lighter, easier and faster to install or repair, does not corrode quickly, does not accumulate heavy mineral and scale deposits, and is resistant to damage. Copper has entirely replaced galvanized pipe as the material of choice for interior water supply lines. Use of copper pipe in underground exterior applications is limited by the cost of the material. The current cost of materials to run one hundred feet of one inch underground (type K) copper line with two tees is currently \$223.47. The material cost for galvanized iron is \$122.96, and for schedule 80 PVC, it's only \$45.77.

Fittings used with copper pipe are generally wrot copper or cast brass and may be threaded or have a smooth interior.

Threaded fittings must be sealed in the same way as for galvanized pipe. Smooth "cup" fittings are sweat soldered. A "tee" which has a cup on both ends and is threaded on the side would be identified as CxCxT, or cup (one end) by cup (other end) by thread (side). Although the terms for identifying fittings vary, the order in which the openings are identified is not. Fittings are always identified by (1) large end, then (2) small end, then (3) large side, and then (4) small side.

HOW TO ORDER FITTINGS

When ordering a fitting, specify size pipe it is to fit. If different pipe sizes are involved, specify sizes in "A-B-C" sequence per illus, above,

Copper plumbing materials may be mixed with galvanized and/or PVC materials in the same system. Whenever copper pipe is joined to galvanized pipe the dissimilar metals generate an electrical current which is destructive to the iron pipe. To prevent this "electrolysis" from occurring, the copper and galvanized iron pipe must be insulated from each by installing a dielectric union.

23.	There are two kinds of copper pipe available. They are	and
24.	Rigid copper pipe is sold in lengths of or feet.	
25.	Flexible copper pipe is sold in sixty-foot long	
26.	Copper pipe (sometimes called copper tubing) ispipe in almost every application.	_ to galvanized

27.	Copper has entirely replaced galvanized pipe as the material of choice for water supply lines.
28.	A wrot copper fitting having a "cup" end would be joined to the pipe by
29.	A wrot copper fitting identified as CxCxT, 3/4 x 3/4 x 1/2 would have a side opening that is inch diameter.

Plastic Pipe

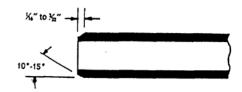

Plastic water pipe is lightweight, easy and fast to install or repair, does not corrode, does not accumulate mineral and scale deposits, and is very economical. Polyvinyl Chloride (PVC) plastic pipe is used extensively outdoors for water supply lines and irrigation systems. PVC water pipe is usually colored white (schedule 40) or gray (schedule 80). Yellow plastic pipe is CPVC, which is approved for both hot and cold water systems. Orange PVC plastic pipe is manufactured for use with gas and is never used in water systems. Rigid black plastic pipe is used only for DWV systems, and is never used for water supply.

PVC plastic pipe is not subject to deterioration from water or corrosion, but it is weakened and made brittle by ultraviolet light. It is very important to store PVC pipe out of direct sunlight. Because plastic does not resist mechanical damage as well as galvanized iron or copper pipe, it is not a good choice of material to use in exposed locations, in rocky soil, or in unstable geologic areas that are prone to movement.

Plastic pipe fittings are similar to copper fittings in that they may be either threaded or smooth. Smooth plastic fittings are referred to as "slip" fittings and are joined to plastic pipe by "solvent welding". Threaded fittings, available in male pipe thread and female pipe thread, are assembled in much the same way as threaded iron and copper pipe. Adapters are use to join plastic pipe with treaded material. Plastic pipe threads must be sealed, however, with pipe thread (TEFLON) tape. Because chemical solvents can weaken plastic pipe, pipe joint compound must never be used on plastic threads.

Experience has proven that poor solvent cementing causes 95% of all PVC failures and leaks. DO NOT TAKE SHORT CUTS or try to save on solvent cement! Make sure that pipe and fittings are of the same material. Do not mix PVC & CPVC components. Be sure to use the correct cement! GSR, a major manufacturer of PVC pipe, recommends the following steps for solvent welding schedule 80 PVC pipe and fittings.

- A. Cut pipe to the desired length. Pipe must be cut square. Use power cut off saw, plastic tubing cutter, or saw and miter box.
- B. Chamfer end of pipe:
- C. Use a clean rag to remove dirt, moisture, and

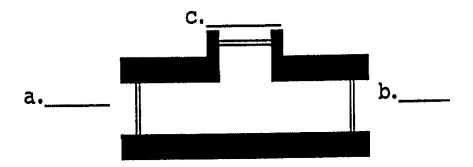

grease from the fitting.

- D. "Dry fit" pipe 1/3 to 3/4 depth of socket.
- E. Apply an even coat of primer to the pipe end and fitting socket until the surface begins to dissolve. Apply with brush or applicator.
- F. While the primer is still wet (for PVC) or tacky (for CPVC), apply an even coating of cement to the pipe end. Be sure there are no voids!
- G. While the primer is still wet (for PVC) or tacky (for CPVC), apply an even coating of cement to the fitting socket. Be sure there are no voids!
- H. Flow on a second full even coating to the pipe end. There must be more cement applied than appears necessary to fill the pipe joint. Use cement liberally!
- I. Quickly, while surfaces are soft and wet with solvent, force pipe into the fitting socket, giving the pipe a quarter turn. The pipe must be bottomed in the socket and held firmly for approximately 30 seconds. If not held, the pipe will try to push out.
- J. Wipe away excess cement. A properly made joint will normally show a bead of cement around the entire perimeter. Gaps may indicate a poor joint due to insufficient cement or the use of a light bodied cement.
- K. Do not disturb the joint until initial setup of the cement occurs.
 Recommended set time is related to air temperature as follows:

30 minutes	Minimum At	50 to 100 degrees F
2 Hours	Minimum At	40 to 60 degrees F
4 Hours	Minimum At	20 to 40 degrees F
6 Hours	Minimum At	0 to 20 degrees F
		_

	o House Hamman 71. The degrees i
30.	PVC stands for
31.	Plastic pipe is light weight, does not corrode and does not accumulateand deposits.
32.	CPVC pipe can be used to transport water.
33.	PVC pipe should not be stored in direct sunlight because can make it brittle.
34.	PVC fittings are available in both "slip" and "threaded" varieties. The "slip" fittings are to the pipe with solvent cement.
35.	Male and female transition couplings called "adapters" are used to link plastic pipe

36.	air temperature is an important consideration when cementing PVC pipe. Colde air temperature requires waiting to pressurize the line.
37.	PVC threads should be sealed with
38.	A PVC fitting identified as SxTxS, 3/4 x 1/2 x 3/4, would be a tee with a threaded

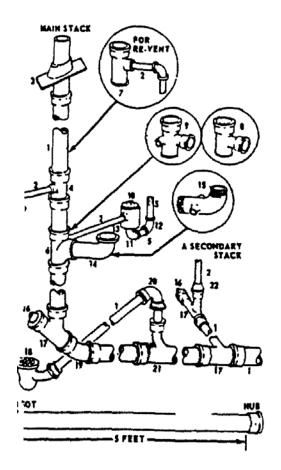

opening at letter , and sized as follows:

DRAIN WASTE AND VENT

The Uniform Plumbing Code (UPC) and California Plumbing Code (CPC) state that "It shall be unlawful for any person to cause, suffer, or permit the disposal of sewage, human excrement or other liquid wastes, in any place or manner, except through and by means of an approved plumbing and drainage system installed and maintained in accordance with the provisions of this Code." "All plumbing fixtures, drains, appurtenances and appliances, used to receive or discharge liquid wastes or sewage, shall be connected properly to the drainage system of the building or premises.....[and] every building in which plumbing fixtures are installed shall have a connection to a public or private sewer...".

At one time DWV systems were manufactured primarily from leaded cast iron and threaded steel pipe. These materials are still found in many state park facilities but, today, much of the old style bell and spigot cast iron pipe has been replaced with "hubless" or "no-hub" cast iron pipe. Hubless pipe is connected with neoprene and stainless steel "no-hub" connectors.

SELECTING DRAINAGE PIPE AND FITTINGS

CAST-IRON AND THREADED STEEL PIPES

Cast-Iron pipe has long been used for stacks, buildi and sewers, and any drains buried underground. Pi in 2- and 4-in, sizes, in 5-ft, lengths either with 2 end or with hubs at both ends (for making two sho end pieces). Threaded, galvanized steel pipe — av 1-1/2- and 2-in, sizes in 21-ft, lengths — is gener with cast iron for branch drains and vent lines, an times) for secondary stacks. Steel pipe, however, be buried underground.

So-called "sanitary" fittings must be used for asser drainage lines. These come in both hub-type casi threaded iron offs. 10A). "Straight" (not sanitary) and "ordinary" (not sanitary) threaded fittings are vent runs where gases only (no water) will pass throads.

The most common materials used in modern DWV systems are ABS plastic and copper. ABS pipe is restricted by Code to residential construction less than two stories in height, but is still the material of choice for most state park DWV system repairs. ABS is black in color, light-weight, easy to work, is resistant to chemicals and corrosion, and is economical. Fittings used with ABS pipe may be threaded or smooth. Terms such as hub, spigot, female pipe thread, and male pipe thread allude to the old cast iron and steel DWV nomenclature to describe modern ABS plastic fittings. A "hub" denotes a smooth bell, or "female" fitting which is designed to receive the end of a pipe or the smooth "spigot" end of another fitting. Hub and spigot ABS plastic fittings resemble the familiar PVC plastic "slip" fittings. ABS fittings are assembled and solvent welded like PVC but, when solvent welding ABS plastic, be sure to use ABS cement. PVC cement will not work with ABS pipe. As with other plastic pipe, threaded ABS fittings are sealed with thread sealing (TEFLON) tape.

The following pages are copied from a GSR company catalog to show some of the wide variety of ABS fittings available. Note the "part number" for each different item and size. Fittings manufactured by GSR have the part numbers cast into the side of each fitting to simplify identification. Compression fittings are available which will allow ABS pipe to be easily connected to cast iron, vitreous clay, and to other common DWV materials.

DRAIN-WASTE-VENT FITTINGS

For Non-Pressure Applications Material: ABS-1 Black

Raw sewage is a biological hazard, which may endanger the health of employees, the public, and the environment. Park maintenance workers must treat a sewage leak or spill as a serious event. For small spills, the typical treatment is to collect and return as much of the spilled material possible to the sewer system and then to disinfect the contaminated area. Hard (paved) surfaces are disinfected with a chlorine solution. Soft surfaces (dirt) are disinfected by spading agricultural lime into the contaminated soil. If a large spill occurs, notify your supervisor. Your supervisor will direct clean-up of the material in compliance with your district's emergency response plan.

In the event of any hazardous spill:

- 1. Avoid contact with the substance (stay upwind and uphill).
- 2. Secure the area to prevent others from contacting the substance.

	3. Immediately notify your supervisor or a peace-officer of the incident.
39.	It is unlawful for any person to dispose of in any place or manner except by means of an approved plumbing and drainage system.
40.	Every building in which plumbing fixtures are installed shall have a connection to a public or private
41.	is a biological hazard, which may pose serious health risks to employees, the public, and the environment.

FUEL SUPPLY (GAS) SYSTEM

The most common gaseous fuels are natural gas, propane, and butane. Most gases are odorless and must be treated with an odorizer to make them noticeable when a leak occurs. Propane and butane are liquefied petroleum (LP) gases. Of the two, propane is the more widely used fuel because it will gasify at lower temperatures. Propane has a heating value of over twice that of natural gas. Since liquefied petroleum vapors are heavier than air, no devices served by LPG may be located in an unvented pit or basement.

Materials used in gas systems are wrought iron or steel (galvanized or black), yellow brass or copper, approved PVC or PE. Valves manufactured for use in gas systems are stamped with the initials "AGA" on the valve body. Code states that no gas piping shall be installed in or on the ground under any building or structure, and that all gas piping in or under the building must be kept at least six (6) inches above grade. PVC and PE pipe may be used only for natural gas only in exterior buried locations. Copper pipe to be used with natural gas must be internally tinned to prevent internal corrosion by the gas itself. Steel pipe used underground must be protected from corrosion by approved "machine applied" protective coatings such as "Extru coat". Galvanized coating is not an approved protective coating. Underground steel pipe must have a minimum of twelve (12) inches of earth cover. Risers must be spirally wrapped with 10-mil ("pipe wrap") tape to a minimum 40-mil thickness from twelve (12) inches below the soil to six (6) inches above grade.

Materials used in gas systems are cut, threaded, and assembled in much the same way as are materials used in water systems. Coated steel pipe for underground must, however, have several inches of the coating removed from the end before threading. Since no portion of the pipe may be left uncoated, all fittings and removed or tool damaged coating must be "wrapped" to a 40 mil thickness with "pipe wrap".

After a gas line has been assembled it must be tested. For most small systems, the Code requires that a gage is installed and the system is pressurized with air, CO-2, or nitrogen to a minimum of ten (10) p.s.i. of pressure for a minimum of fifteen (15) minutes. Because different materials and systems have different test requirements, it is always necessary to check the Code for each specific application. If the system looses pressure during the test, leaks in the piping must be located by applying soapy water to the exterior of the pipe. Flame, acid, or LPG <u>will not</u> be used to locate or repair leaks.

59.	Liquefied petroleum vapors are than air.
60.	gas pipe used underground must be protected from corrosion by approved "machine applied" protective coatings.
61.	Galvanized coating is / is not an approved protective coating for underground gas pipe.
62.	After a gas line has been assembled it must be
63.	Because different materials and systems have different test requirements, it is always necessary to check the for each specific application.
64.	Leaks in gas piping must be located by applying

REPAIRS

Pipe Repairs

When a park maintenance worker is called on to repair a leaking pipe, it will most likely be outdoors or underground. Underground leaks may show up as moving water on the surface of the ground, as persistent damp spots, or areas with unusually green grass. Leaks can be hard to find. Water will often travel several feet before appearing on the surface. Some leaks may not show up on the surface at all. A professional leak detective with special equipment may be needed to locate hard to find leaks.

Repairing an underground leak is different than repairing a leak in a building. If a leak occurs in a building, the water is turned off immediately to minimize water damage. When an underground leak is detected, it's important to leave the water on whenever possible. Turning off the water will make it more difficult to pinpoint the exact location of the leak and may allow contamination to be drawn into the system.

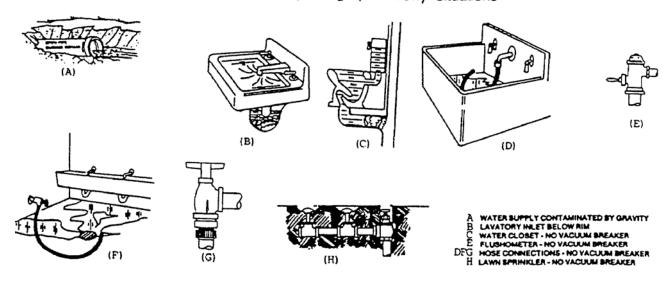

When repairing an underground leak, the first thing that must be done is to determine how the water will be removed from the hole that you are about to create. If the surrounding area has enough slope, a trench may be dug downhill leading away from the leak. The area must slope enough to allow the trench to drain a work area that is at least six inches below the pipe to be repaired. If the work area is environmentally sensitive, contains cultural artifacts, or has insufficient slope for adequate drainage, a pump must be used. When a pump is used, a sump must be dug for the suction line. The sump must be deep enough to accommodate both the drafting screen on the suction line and provide six inches of dry working space below the pipe to be repaired.

Make sure that the excavation is large enough to provide adequate working space to manipulate wrenches, etc., as well as to allow repairing the leak <u>above</u> any standing water. If the pipe is buried deeper than four (4) feet, shoring or benching must be provided for worker safety (Construction Safety Orders 1540-1541, provided in class).

After the leak is located and the damaged area of the pipe has been exposed, the water may be turned off and the leak repaired. If the pipe must be cut and a section replaced , the line must be sanitized according to American Waterworks Association Standard C601-81. Sanitation may be accomplished by slug chlorination, swabbing with hypochlorite solution or tablets, and flushing. A compression clamp can often be used to stop a leak without turning off the water. If a repair is made without turning off the water, sanitation is not required. A free chlorine test should be performed to ensure a residual is present in the system.

Maintenance workers must always be alert for any condition, which might allow pollutants to back-siphon into the water supply system. Besides damaged pipes, cross-connections may occur from conditions such as hoses and irrigation systems without backflow devices, and old style plumbing fixtures.

Cross Connections High Risk Back-Siphonage (back-flow) Situations

65.	When an underground leak is located, the water should be whenever possible to avoid the system.
66.	If an excavation is dug deeper than four (4) feet, or benching must be provided for worker safety.
67.	If a water supply pipe must be cut and a section replaced, the line must beaccording to AWWA Standard C601-81.
68.	Sanitation may be accomplished by slug, swabbing with hypochlorite solution or tablets, and flushing.
69.	Hoses connected to sink faucets which might back-siphon pollutants into the water supply system are examples of

Valves

65

Valves are the part of the plumbing systems that allow the user to control the flow of fluid or gas. Because the components of valves move, they are subject to mechanical abrasion and wear. Valves may leak externally or internally. An external leak commonly occurs when the packing around the stem wears down. An internal leak occurs when the valve gate, washer, or seat is worn away. External leaks, and some internal leaks (such as a dripping faucet), may be visibly detected. Internal leaks in main system shutoff valves cannot be visibly detected and usually go undiscovered until the water to the system must be shut off, but cannot be. Because water is abrasive, gate valves should never be operated partly open. The water will wear away the gate or seat if restricted. To replace valve stem packing, the packing nut must be removed.

02/10/11 19 The valve stem must be removed to replace the washer and/or valve seat. Lubricate valve and faucet stems with Non Petrolieum grease.

Besides leaking, valves that are infrequently moved present an additional problem. The spaces around movable parts of the valve can become filled with minerals, rust, scale, and sand. If these materials are allowed to collect for long periods of time, the valve will become inoperable. To minimize this problem, a good maintenance program will include "exercising" the valves on system mains. Exercising a valve means to move the valve gate through its entire range, from the full open to full closed position, several times to dislodge any materials which may have collected in the mechanism.

70.	A valve is used to the flow of fluid or gas.
71.	An external leak occurs when the wears out around the stem.
72.	Gate valves should never be operated opened.
	The spaces around movable parts of the valve can become filled with,, and
74.	To replace valve stem packing, the must be removed.
75.	To replace a valve seat or seat washer, the must be removed.
76.	A good maintenance program will include "",, and all main water shutoff valves.

Faucets

Faucets are simply valves used to control the flow of water in a sink, tub, or shower. There are two basic kinds of faucets, compression and washerless. A compression faucet uses a washer pressed against a valve seat to close. Repairs to compression faucets usually require replacement of deteriorated washers and/or seats. Valve seats can be replaced or dressed. Washerless faucets line up ports in the cartridge and body to allow water to flow. Washerless faucets usually require replacement of seals and springs, or replacement of a cartridge. Hot and cold water may be reversed if the cartridge is installed incorrectly. Repair parts for major brands of faucets are available in most building supply outlets. Be sure to have the manufacturer's name and model number available when shopping for parts. An aerator is placed in the tip of most faucet spouts. Particles can clog the screen in the aerator and restrict the flow.

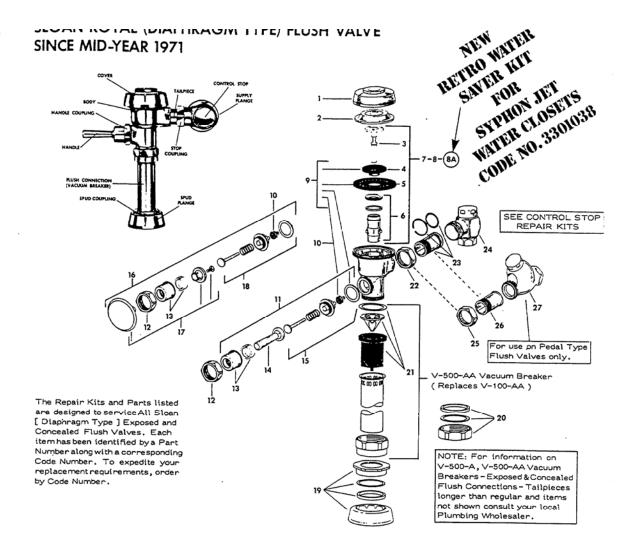

77.	A compression faucet closes by compressing aseat.	_ against a valve
78.	A dripping faucet is usually the result of a deteriorated	or valve seat

Toilets

To replace the wax gasket for a toilet with a wall mounted tank, the 90-degree supply pipe must be removed to allow the bowl to be lifted from the floor. Modern bowl mounted tank toilets do not, however, need to be disassembled to replace the wax gasket. If the tank is separated from the bowl, special care must be taken to avoid over tightening the mounting bolts and cracking the bottom of the tank. Additionally, the wax gasket with a plastic cone ("No Seep") may be used with most bottom discharging toilets on any floor surface and will greatly reduce the chance of future leaks. Wax gaskets are not recommended for wall-hung toilet bowls. Wall-hung toilets require a special gasket made of wax impregnated felt or synthetic foam. A tank toilet that runs continuously may have a problem with the ballcock or the float ball.

Tank toilets are used primarily in residential housing and facilities having low water pressure or volume. For high use public facilities, a tankless, pressure flush style toilet is preferred. The flushing action of pressure flush toilets is controlled by a flush valve, commonly called a flushometer. Flushometers provide quick recovery and good control of water consumption for facilities that serve large numbers of people. Flushometers have four basic components: a control stop to regulate the water entering the flush valve, a flush valve to control the length of flush, a handle assembly to activate the valve, and a vacuum breaker to prevent accidental contamination of the water supply system (cross connection).

A major manufacturer of flushometers is the Sloan Valve Company. Sloan manufactures several types of flush valves, including the very popular Royal and Crown models. The Royal and Crown valves employ operating principles that are typical of many major brands of flush valves. Royal flush valves use a diaphragm to regulate the flushing cycle, and Crown valves use a piston. Components and troubleshooting suggestions on the following pages are excerpts from the Sloan Repair Parts/Maintenance Guide. The guide, parts catalog, and repair parts price list are available free from the statewide contract vendor for Sloan parts.

Troubleshooting and Maintaining the ROYAL Flush Valve

1 PROBLEM: Valve does not function.

CAUSE: Control stop or main valve is closed. SOLUTION: Open control stop or main valve.

2 PROBLEM:

Insufficient volume of water to adequately siphon fixture.

CAUSE:

(a) Control stop not open enough.(b) Urinal Valve parts installed in Closet Valve.

(c) Inadequate volume or pressure at supply.

SOLUTION:

(a) Adjust control stop for desired delivery of water.

(b) Replace inside Urinal Valve parts with proper Closet Valve parts.

(c) If no gauges are available to properly measure supply pressure or volume of water at the Valve, then completely remove the entire Diaphragm Assembly (7–8) and open the control stop to allow water to pass through the empty valve. If the supply is adequate to siphon the fixture in this manner the Restriction Ring (A–32 on brass guides, A–164 on Cycolac guides) may be removed from the bottom of the guide to provide additional flow or a Sloan Guide Assembly (A–13–A Fullback) may be installed in the Valve. Should neither of these steps prove satisfactory, steps should be taken to increase the

pressure and/or supply.

3 PROBLEM:

Valve closes off immediately.

CAUSE:

(a) Ruptured or damaged diaphragm.

SOLUTION:

(b) Enlarged by-pass orifice from corrosion or damage.

Install Inside Parts Kit (3301036 or 3301037) to correct above problem

and update Flush Valve.

4 PROBLEM:

CAUSE:

Length of flush too short (short flushing).

(a) Diaphragm assembly and Guide assembly are not hand-tight.

(b) Enlarged by-pass orifice from corrosion or damage.

(c) A-19-AU Urinal Relief Valve in Closet Flush Valve.

SOLUTION:

(a) Screw the two assemblies hand-tight.

(b) Install Inside Parts Kit (3301036 or 3301037) to correct problem

and update Flush Valve.

(c) Install Inside Parts Kit (3301036 or 3301037) to correct problem

and update Flush Valve.

5 PROBLEM:

Length of flush too long (long flushing) or failing to close off.

CAUSE:

(a) Relief Valve (A-19-A) is not seating properly or by-pass orifice is clogged because of foreign material, or by-pass orifice is closed by an invisible gelatinous film from "overtreated" water.

(b) Line pressure has dropped and is not sufficient to force Relief Valve

to seat.

(c) A-19-A Brass Relief Valve has been replaced by an A-19-A

Delrin Relief Valve.

SOLUTION:

(a) Disassemble the working parts and wash thoroughly. NOTE: The size of the orifice in the by-pass is of the utmost importance for the proper metering of water into the upper chamber of the valve. DO NOT enlarge or damage this orifice.

(b) Shut off all control stops until pressure has been restored, then open them again.

(c) Install Inside Parts Kit (3301036 or 3301037) to correct problem

and update Flush Valve.

6 PROBLEM:

Water splashes out of fixture.

CAUSE:

SOLUTION:

(a) Supply volume is more than is necessary.

(b) Lime accumulation on vortex or spreader holes.

(a) Throttle down control stop.(b) Remove the lime build-up.

7 PROBLEM:

Flush is not considered "QUIET".

CAUSE:

- (a) Control stop may not be adjusted for quiet operation.
- (b) Flush Valve is old model Valve which does not contain "QUIET" features.
- (c) Fixture may be contributing noise.
- (d) Conditions in piping system may be contributing noise.

SOLUTION:

(a) Adjust the control stop for quiet operation while Valve is flushing, bearing in mind the fixture requirements for proper siphonage.
(b) Install Inside Parts Kit (3301036 or 3301037) and Control Stop Parts Kit.(see Control Stop Repair Kits for Identification).

(c) Determine that the noise is in the fixture by covering the fixture with a "quilt" or by placing cardboard under toilet seat, to separate bowl noise from Valve noise. If the fixture proves to be noisy, it should be replaced by a quiet-action fixture.

(d) A degree of high pressure in the piping system may be dealt with by adjustment of the control stop. Other noises which may be created by loose pipes, lack of air chambers, inadequate pipe sizes for pressure, etc., must be taken up with the building engineer.

8 PROBLEM: CAUSE: Chattering noise in Flush Valve.

(a) An A-56-A or A-156-A Segment Diaphragm has been installed in an old style valve which contained an A-26-A Rubber Diaphragm and a

tight-fitting brass guide.

(b) The A-56-A or A-156-A Segment Diaphragm has been installed upside down.

(c) The In SOLUTION: (a) Remo

(c) The Inside Cover has been distorted from freezing or abuse.(a) Remove the brass Guide Assembly and stroke each of the 4 wings of

the guide with a file about six times, or install Inside Parts Kit

(3301036 or 3301037).

(b) Replace the Segment Diaphragm to the proper position as instructed by markings on the diaphragm.

(c) This necessitates replacing Old Style Inside Cover with both New

Style Inside and Outside Covers. (see Parts List).

9 PROBLEM: CAUSE: Leaking at Handle Assembly.

(a) Valve is old style and Handle Packing is worn.

(b) Handle Gasket has been omitted.

(c) The B-39 Seal may have deteriorated from exposure to heat before

installation or from inactivity.
SOLUTION: (a) Install Stoan Handle Repair

ION: (a) Install Stoan Handle Repair Kit (3302305).

(b) Install Sloan Handle Repair Kit (3302305). (c) Install new B-39 Seal (3302297).

NOTE: The B-39 Seal will easily slide right onto the B-40 Bushing if

it is wet.

CHROME DISCOLORATION:

Discoloring or spotting of chrome plated parts is a result of cleaning compounds containing muriatic acid which is found in commercial cleaning compounds. The presence of this acid (a minimum of 7%) removes the chrome and exposes the nickel.

A suggested recommendation for cleaning chrome plated parts is merely to clean them with soap and water and then rub dry with a dry towel or cloth. It is not necessary to use a commercial cleaning compound to clean or bring out the lustre of the chrome.

PROTECTI AGAINST "FREEZE" DAMAGE:

If a building (e.g. stadium, beach house, etc.) is deactivated and such building is located in an area of the country subject to freezing temperatures, the procedure listed below should be followed to prevent "freeze" damage to the flush valves.

- 1 Shut off main supply valve and drain all water from the piping system.
- 2 Remove bonnet and inside parts from control stop of each flush valve to drain the water retained in the flush valve.

89.	If a tank type toilet continuously runs water, the trouble is most likely associated with the or
90.	Tank toilets are used primarily in residential housing and facilities having water pressure or volume of use.
91.	provide quick recovery and good control of water consumption for facilities that serve large numbers of people.
92.	If a Royal flush valve continues to run after the toilet is flushed, the first thing to check is the in the diaphragm.
93.	If water splashes out of the fixture when it is flushed, the control may need to be adjusted.
94.	Cleaning compounds containing acid will remove the chrome finish on a flush valve and cause discoloration.
95.	The manufacturer of Royal flush valves suggests the valve be cleaned with and, then dry.
96.	Wax gaskets are not recommended fortoilet bowls.
97.	If a toilet tank is separated from the bowl, over tightening the mounting bolts will result in the bottom of the tank.
98.	Water into the flushometer is controlled by the
